

Phase 14: Assumption Discipline

The active assumptions are organized in four blocks: demand and commercial returns; manufacturing technologies; project advancement; and CMO-market regularity. Architecture guards and derived conclusions are separately identified. Each proposition records the assumptions actually used.

The realization level enters route value and therefore advancement; only a direct policy shift of that probability is excluded. Interior derivatives, endpoint continuity, no-tie and integrable-envelope conditions are explicit. No desired policy sign, class ranking or patent response is an assumption.
