

Phase 12: Crosswalk Audit

The current revision follows the execution note and amendment v1.1. Twenty-four legacy object families have explicit deletion, replacement, retention or extension-isolation decisions. The historical occurrence index contains 1,242 exact source-line matches across thirteen files at the locked Git snapshot. A separate September 1 occurrence index identifies the current revision layer. The manuscript remains protected.

The primary audit deliverable is the accompanying Markdown crosswalk and its occurrence-level CSV evidence. This wrapper only verifies that the current review materials compile; it is not the Phase 15 full draft.
